**Anti-CREB3L1 Picoband Antibody - Protein Information**

**Name** CREB3L1 ([HGNC:18856](#))

**Function**

[Cyclic AMP-responsive element-binding protein 3-like protein 1]: Precursor of the transcription factor form (Processed cyclic AMP- responsive element-binding protein 3-like protein 1), which is embedded in the endoplasmic reticulum membrane with N-terminal DNA-binding and transcription activation domains oriented toward the cytosolic face of the membrane (PubMed:<a href="http://www.uniprot.org/citations/12054625" target="\_blank">12054625</a>, PubMed:<a href="http://www.uniprot.org/citations/16417584" target="\_blank">16417584</a>, PubMed:<a href="http://www.uniprot.org/citations/25310401" target="\_blank">25310401</a>). In response to ER stress or DNA damage, transported to the Golgi, where it is cleaved in a site-specific manner by resident proteases S1P/MBTPS1 and S2P/MBTPS2. The released N-terminal cytosolic domain is translocated to the nucleus where it activates transcription of specific target genes involved in the cell-cycle progression inhibition (PubMed:<a href="http://www.uniprot.org/citations/12054625" target="\_blank">12054625</a>, PubMed:<a href="http://www.uniprot.org/citations/21767813" target="\_blank">21767813</a>, PubMed:<a href="http://www.uniprot.org/citations/25310401" target="\_blank">25310401</a>).

#### Anti-CREB3L1 Picoband Antibody - Background

CREB3L1, known as Cyclic AMP-responsive element-binding protein 3-like protein 1, is mapped to 11p11.2. The protein encoded by this gene is normally found in the membrane of the endoplasmic reticulum (ER). However, upon stress to the ER, the encoded protein is cleaved and the released cytoplasmic transcription factor domain translocates to the nucleus. There it activates the transcription of target genes by binding to box-B elements.
