**Name** WNT2

**Synonyms** INT1L1, IRP

### Function

Ligand for members of the frizzled family of seven transmembrane receptors. Functions in the canonical Wnt signaling pathway that results in activation of transcription factors of the TCF/LEF family (PubMed: [20018874](http://www.uniprot.org/citations/20018874)). Functions as an upstream regulator of FGF10 expression. Plays an important role in embryonic lung development. May contribute to embryonic brain development by regulating the proliferation of dopaminergic precursors and neurons (By similarity).

### Cellular Location

Secreted, extracellular space, extracellular matrix. Secreted

### Tissue Location

Expressed in brain in the thalamus, in fetal and adult lung and in placenta.
