UBE2C / UBCH10 Antibody (internal region) - Protein Information**Name** UBE2C**Synonyms** UBCH10**Function**

Accepts ubiquitin from the E1 complex and catalyzes its covalent attachment to other proteins. In vitro catalyzes 'Lys-11'- and 'Lys-48'-linked polyubiquitination. Acts as an essential factor of the anaphase promoting complex/cyclosome (APC/C), a cell cycle-regulated ubiquitin ligase that controls progression through mitosis. Acts by initiating 'Lys-11'-linked polyubiquitin chains on

APC/C substrates, leading to the degradation of APC/C substrates by the proteasome and promoting mitotic exit.
