**CD55 Antibody (aa71-330) - Protein Information****Name** CD55**Synonyms** CR, DAF**Function**

This protein recognizes C4b and C3b fragments that condense with cell-surface hydroxyl or amino groups when nascent C4b and C3b are locally generated during C4 and c3 activation. Interaction of daf with cell-associated C4b and C3b polypeptides interferes with their ability to catalyze the conversion of C2 and factor B to enzymatically active C2a and Bb and thereby prevents the formation of C4b2a and C3bBb, the amplification convertases of the complement cascade (PubMed:<a href="http://www.uniprot.org/citations/7525274" target="\_blank">7525274</a>). Inhibits complement activation by destabilizing and preventing the formation of C3 and C5 convertases, which prevents complement damage (PubMed:<a href="http://www.uniprot.org/citations/28657829" target="\_blank">28657829</a>).

### Cellular Location
