

HNMT Antibody(Ascites)
Mouse Monoclonal Antibody (Mab)
Catalog # AM2023a

Specification

HNMT Antibody(Ascites) - Product Information

Application	WB,E
Primary Accession	P50135
Other Accession	NP_008826.1
Reactivity	Human
Host	Mouse
Clonality	Monoclonal
Isotype	IgG1
Calculated MW	33295

HNMT Antibody(Ascites) - Additional Information

Gene ID 3176

Other Names

Histamine N-methyltransferase, HMT, HNMT

Target/Specificity

Purified His-tagged HNMT protein(Fragment) was used to produced this monoclonal antibody.

Dilution

WB~~1:100~8000

Format

Mouse monoclonal antibody supplied in crude ascites with 0.09% (W/V) sodium azide.

Storage

Maintain refrigerated at 2-8°C for up to 2 weeks. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.

Precautions

HNMT Antibody(Ascites) is for research use only and not for use in diagnostic or therapeutic procedures.

HNMT Antibody(Ascites) - Protein Information

Name HNMT

Function Inactivates histamine by N-methylation. Plays an important role in degrading histamine and in regulating the airway response to histamine.

Cellular Location

Cytoplasm.

HNMT Antibody(Ascites) - Protocols

Provided below are standard protocols that you may find useful for product applications.

- [Western Blot](#)
- [Blocking Peptides](#)
- [Dot Blot](#)
- [Immunohistochemistry](#)
- [Immunofluorescence](#)
- [Immunoprecipitation](#)
- [Flow Cytometry](#)
- [Cell Culture](#)

HNMT Antibody(Ascites) - Images

HNMT Antibody (Cat. #AM2023a) western blot analysis in HepG2 cell line lysates (35µg/lane). This demonstrates the HNMT antibody detected the HNMT protein (arrow).

HNMT Antibody(Ascites) - Background

In mammals, histamine is metabolized by two major pathways: N(tau)-methylation via histamine N-methyltransferase and oxidative deamination via diamine oxidase. This gene encodes the first enzyme which is found in the cytosol and uses S-adenosyl-L-methionine as the methyl donor. In the mammalian brain, the neurotransmitter activity of histamine is controlled by N(tau)-methylation as diamine oxidase is not found in the central nervous system. A common genetic polymorphism affects the activity levels of this gene product in red blood cells. Multiple alternatively spliced transcript variants that encode different proteins have been found for this gene.
