**Anti-Beta-actin Antibody - Protein Information**

**Name** actba

**Synonyms** bact, bactin1, bactzf

**Function**

Actin is a highly conserved protein that polymerizes to produce filaments that form cross-linked networks in the cytoplasm of cells. Actin exists in both monomeric (G-actin) and polymeric (F-actin) forms, both forms playing key functions, such as cell motility and contraction. In addition to their role in the cytoplasmic cytoskeleton, G- and F-actin also localize in the nucleus, and regulate gene transcription and motility and repair of damaged DNA.

**Cellular Location**

Cytoplasm, cytoskeleton {ECO:0000250|UniProtKB:P60710}. Nucleus

{ECO:0000250|UniProtKB:O93400}

#### Tissue Location

Skeletal muscle, heart, gill, digestive tissue and brain (PubMed:9987040). Widespread expression throughout the brain, with highest levels in regions where neuronal proliferation is greatest (PubMed:9987040).
