EIF2By Polyclonal Antibody - Protein Information**Name** EIF2B3**Function**

Acts as a component of the translation initiation factor 2B (eIF2B) complex, which catalyzes the exchange of GDP for GTP on the eukaryotic initiation factor 2 (eIF2) complex gamma subunit (PubMed: [25858979](http://www.uniprot.org/citations/25858979)), (PubMed: [27023709](http://www.uniprot.org/citations/27023709)), (PubMed: [31048492](http://www.uniprot.org/citations/31048492)). Its guanine nucleotide exchange factor activity is repressed when bound to eIF2 complex phosphorylated on the alpha subunit, thereby limiting the amount of methionyl-initiator methionine tRNA available to the ribosome and consequently global translation is repressed (PubMed: [25858979](http://www.uniprot.org/citations/25858979)), (PubMed: [31048492](http://www.uniprot.org/citations/31048492)).
