

ALDH1A1 Rabbit mAb
Catalog # AP74894**Specification****ALDH1A1 Rabbit mAb - Product Information**

Application	WB, IHC
Primary Accession	P00352
Reactivity	Human, Mouse
Host	Rabbit
Clonality	Monoclonal Antibody
Calculated MW	54862

ALDH1A1 Rabbit mAb - Additional Information

Gene ID 216

Other Names

ALDH1A1

Dilution

WB~~1/500-1/1000

IHC~~1/50-1/100

Format

Liquid

ALDH1A1 Rabbit mAb - Protein InformationName ALDH1A1 ([HGNC:402](#))**Function**

Cytosolic dehydrogenase that catalyzes the irreversible oxidation of a wide range of aldehydes to their corresponding carboxylic acid (PubMed: [12941160](http://www.uniprot.org/citations/12941160), PubMed: [15623782](http://www.uniprot.org/citations/15623782), PubMed: [17175089](http://www.uniprot.org/citations/17175089), PubMed: [19296407](http://www.uniprot.org/citations/19296407), PubMed: [25450233](http://www.uniprot.org/citations/25450233), PubMed: [26373694](http://www.uniprot.org/citations/26373694)). Functions downstream of retinol dehydrogenases and catalyzes the oxidation of retinaldehyde into retinoic acid, the second step in the oxidation of retinol/vitamin A into retinoic acid (By similarity). This pathway is crucial to control the levels of retinol and retinoic acid, two important molecules which excess can be teratogenic and cytotoxic (By similarity). Also oxidizes aldehydes resulting from lipid peroxidation like (E)-4-hydroxynon-2-enal/HNE, malonaldehyde and hexanal that form protein adducts and are highly cytotoxic. By participating for instance to the clearance of (E)-4-hydroxynon-2-enal/HNE in the lens epithelium prevents the formation of HNE-protein adducts and lens opacification (PubMed: [12941160](http://www.uniprot.org/citations/12941160), PubMed: [15623782](http://www.uniprot.org/citations/15623782)),

PubMed: [19296407](http://www.uniprot.org/citations/19296407)). Functions also downstream of fructosamine-3-kinase in the fructosamine degradation pathway by catalyzing the oxidation of 3-deoxyglucosone, the carbohydrate product of fructosamine 3-phosphate decomposition, which is itself a potent glycating agent that may react with lysine and arginine side-chains of proteins (PubMed: [17175089](http://www.uniprot.org/citations/17175089)). Has also an aminobutyraldehyde dehydrogenase activity and is probably part of an alternative pathway for the biosynthesis of GABA/4-aminobutanoate in midbrain, thereby playing a role in GABAergic synaptic transmission (By similarity).

Cellular Location

Cytoplasm, cytosol. Cell projection, axon {ECO:0000250|UniProtKB:P24549}

Tissue Location

Expressed by erythrocytes (at protein level).

ALDH1A1 Rabbit mAb - Protocols

Provided below are standard protocols that you may find useful for product applications.

- [Western Blot](#)
- [Blocking Peptides](#)
- [Dot Blot](#)
- [Immunohistochemistry](#)
- [Immunofluorescence](#)
- [Immunoprecipitation](#)
- [Flow Cytometry](#)
- [Cell Culture](#)
