The DRTF1/E2F complex functions in the control of cell-cycle progression from G1 to S phase (PubMed:[10675335](#), PubMed:[12717439](#), PubMed:[17704056](#)). E2F1 binds preferentially RB1 in a cell-cycle dependent manner (PubMed:[10675335](#), PubMed:[12717439](#), PubMed:[17704056](#)). It can mediate both cell proliferation and TP53/p53- dependent apoptosis (PubMed:[8170954](#)). E2F1 Antibody (H357) - Background

E2F1 is a member of the E2F family of transcription factors. The E2F family plays a crucial role in the control of cell cycle and action of tumor suppressor proteins and is also a target of the transforming proteins of small DNA tumor viruses. The E2F proteins contain several evolutionarily conserved domains found in most members of the family. These domains include a DNA binding domain, a dimerization domain which determines interaction with the differentiation regulated transcription factor proteins (DP), a transactivation domain enriched in acidic amino acids, and a tumor suppressor protein association domain which is embedded within the transactivation domain. This protein and another two members, E2F2 and E2F3, have an additional cyclin binding domain. This protein binds preferentially to retinoblastoma protein pRB in a cell-cycle dependent manner. It can mediate both cell proliferation and p53-dependent/independent apoptosis.
