

Raptor Antibody (S863)
Affinity Purified Rabbit Polyclonal Antibody (Pab)
Catalog # AP8015a

Specification

Raptor Antibody (S863) - Product Information

Application	WB, IHC-P-Leica,E
Primary Accession	Q8N122
Reactivity	Human
Host	Rabbit
Clonality	Polyclonal
Isotype	Rabbit IgG
Calculated MW	149038

Raptor Antibody (S863) - Additional Information

Gene ID 57521

Other Names

Regulatory-associated protein of mTOR, Raptor, p150 target of rapamycin (TOR)-scaffold protein, RPTOR, KIAA1303, RAPTOR

Target/Specificity

This Raptor antibody is generated from rabbits immunized with a KLH conjugated synthetic peptide corresponding to amino acid residues surrounding S863 of human raptor.

Dilution

WB~~1:2000
IHC-P-Leica~~1:250

Format

Purified polyclonal antibody supplied in PBS with 0.09% (W/V) sodium azide. This antibody is purified through a protein A column, followed by peptide affinity purification.

Storage

Maintain refrigerated at 2-8°C for up to 2 weeks. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.

Precautions

Raptor Antibody (S863) is for research use only and not for use in diagnostic or therapeutic procedures.

Raptor Antibody (S863) - Protein Information

Name RPTOR ([HGNC:30287](#))

Function Component of the mechanistic target of rapamycin complex 1 (mTORC1), an evolutionarily conserved central nutrient sensor that stimulates anabolic reactions and

macromolecule biosynthesis to promote cellular biomass generation and growth (PubMed:[12150925](#), PubMed:[12150926](#), PubMed:[12747827](#), PubMed:[24403073](#), PubMed:[26588989](#), PubMed:[32561715](#), PubMed:[37541260](#)). In response to nutrients, growth factors or amino acids, mTORC1 is recruited to the lysosome membrane and promotes protein, lipid and nucleotide synthesis by phosphorylating several substrates, such as ribosomal protein S6 kinase (RPS6KB1 and RPS6KB2) and EIF4EBP1 (4E-BP1) (PubMed:[12150925](#), PubMed:[12150926](#), PubMed:[12747827](#), PubMed:[24403073](#), PubMed:[26588989](#), PubMed:[37541260](#)). In the same time, it inhibits catabolic pathways by phosphorylating the autophagy initiation components ULK1 and ATG13, as well as transcription factor TFEB, a master regulators of lysosomal biogenesis and autophagy (PubMed:[12150925](#), PubMed:[12150926](#), PubMed:[12747827](#), PubMed:[24403073](#), PubMed:[32561715](#), PubMed:[37541260](#)). The mTORC1 complex is inhibited in response to starvation and amino acid depletion (PubMed:[12150925](#), PubMed:[12150926](#), PubMed:[12747827](#), PubMed:[24403073](#), PubMed:[37541260](#)). Within the mTORC1 complex, RPTOR acts both as a molecular adapter, which (1) mediates recruitment of mTORC1 to lysosomal membranes via interaction with small GTPases Rag (RagA/RRAGA, RagB/RRAGB, RagC/RRAGC and/or RagD/RRAGD), and a (2) substrate-specific adapter, which promotes substrate specificity by binding to TOS motif- containing proteins and direct them towards the active site of the MTOR kinase domain for phosphorylation (PubMed:[12747827](#), PubMed:[24403073](#), PubMed:[26588989](#), PubMed:[37541260](#)). mTORC1 complex regulates many cellular processes, such as odontoblast and osteoclast differentiation or neuronal transmission (By similarity). mTORC1 complex in excitatory neuronal transmission is required for the prosocial behavior induced by the psychoactive substance lysergic acid diethylamide (LSD) (By similarity).

Cellular Location

Lysosome membrane. Cytoplasm Cytoplasmic granule. Note=Targeting to lysosomes depends on amino acid availability: recruited to lysosome membranes via interaction with GTP-bound form of RagA/RRAGA (or RagB/RRAGB) in complex with the GDP-bound form of RagC/RRAGC (or RagD/RRAGD), promoting recruitment of mTORC1 to the lysosomes (PubMed:[31601708](#), PubMed:[31601764](#)). In arsenite-stressed cells, accumulates in stress granules when associated with SPAG5 and association with lysosomes is drastically decreased (PubMed:[23953116](#)).

Tissue Location

Highly expressed in skeletal muscle, and in a lesser extent in brain, lung, small intestine, kidney and placenta

Raptor Antibody (S863) - Protocols

Provided below are standard protocols that you may find useful for product applications.

Raptor Antibody (S863) - Images

Anti-Raptor(S863) Antibody at 1:2000 dilution + MCF-7 whole cell lysate Lysates/proteins at 20 μ g per lane. Secondary Goat Anti-Rabbit IgG, (H+L), Peroxidase conjugated at 1/10000 dilution. Predicted band size : 149 kDa Blocking/Dilution buffer: 5% NFDM/TBST.

Immunohistochemical analysis of AP8015a on paraffin-embedded human kidney tissue was performed on the Leica® BOND RXm. Tissue was fixed with formaldehyde at room temperature. Heat induced epitope retrieval was performed by EDTA buffer (pH9. 0). Samples were incubated with primary antibody(1:250) for 15min at room temperature. Leica Bond Polymer Refine Detection was used as the secondary antibody.

Raptor Antibody (S863) - Background

Raptor participates in the FRAP1 pathway and associates in a near stoichiometric ratio with FRAP1 to form a nutrient-sensitive complex (NSC). It plays a pivotal role as a scaffold protein in the FRAP1-signaling pathway and this interaction is essential for the catalyzed phosphorylation of EIF4EBP1. It has a positive role in nutrient-stimulated signaling to the downstream effector RPS6KB1. Under nutrient-deprived conditions, it serves as a negative regulator of FRAP1 kinase activity. Regulation of the interaction with FRAP1 is a critical mechanism by which cells coordinate the rate of cell growth and maintenance of cell size with different environmental conditions.
