

**NAK Antibody**  
Catalog # ASC10126**Specification****NAK Antibody - Product Information**

Application	ICC
Primary Accession	<a href="#">O9UHD2</a>
Other Accession	<a href="#">NP_037386</a> , <a href="#">7019547</a>
Reactivity	Human, Mouse
Host	Rabbit
Clonality	Polyclonal
Isotype	IgG
Calculated MW	84 kDa KDa
Application Notes	NAK antibody can be used for detection of NAK/TBK1 by Western blot. An 84 kDa band should be detected. Antibody can also be used for immunocytochemistry starting at 10 µg/mL.

**NAK Antibody - Additional Information**Gene ID **29110****Other Names**

NAK Antibody: NAK, T2K, NAK, NF-kappa-B-activating kinase, TANK-binding kinase 1

**Target/Specificity**

TBK1; No cross response to IKKa, IKKb, IKKy, or IKKe.

**Reconstitution & Storage**

NAK antibody can be stored at 4°C for three months and -20°C, stable for up to one year. As with all antibodies care should be taken to avoid repeated freeze thaw cycles. Antibodies should not be exposed to prolonged high temperatures.

**Precautions**

NAK Antibody is for research use only and not for use in diagnostic or therapeutic procedures.

**NAK Antibody - Protein Information****Name** TBK1 {ECO:0000303|PubMed:10581243, ECO:0000312|HGNC:HGNC:11584}**Function**

Serine/threonine kinase that plays an essential role in regulating inflammatory responses to foreign agents (PubMed:&lt;a href="http://www.uniprot.org/citations/10581243" target="\_blank"&gt;10581243&lt;/a&gt;, PubMed:&lt;a href="http://www.uniprot.org/citations/11839743" target="\_blank"&gt;11839743&lt;/a&gt;, PubMed:&lt;a href="http://www.uniprot.org/citations/12692549" target="\_blank"&gt;12692549&lt;/a&gt;, PubMed:&lt;a href="http://www.uniprot.org/citations/12702806" target="\_blank"&gt;12702806&lt;/a&gt;, PubMed:&lt;a href="http://www.uniprot.org/citations/14703513" target="\_blank"&gt;14703513&lt;/a&gt;, PubMed:&lt;a href="http://www.uniprot.org/citations/15367631" target="\_blank"&gt;15367631&lt;/a&gt;)

target="\_blank">15367631</a>, PubMed:<a href="http://www.uniprot.org/citations/15485837" target="\_blank">15485837</a>, PubMed:<a href="http://www.uniprot.org/citations/18583960" target="\_blank">18583960</a>, PubMed:<a href="http://www.uniprot.org/citations/21138416" target="\_blank">21138416</a>, PubMed:<a href="http://www.uniprot.org/citations/23453971" target="\_blank">23453971</a>, PubMed:<a href="http://www.uniprot.org/citations/23453972" target="\_blank">23453972</a>, PubMed:<a href="http://www.uniprot.org/citations/23746807" target="\_blank">23746807</a>, PubMed:<a href="http://www.uniprot.org/citations/25636800" target="\_blank">25636800</a>, PubMed:<a href="http://www.uniprot.org/citations/26611359" target="\_blank">26611359</a>, PubMed:<a href="http://www.uniprot.org/citations/32404352" target="\_blank">32404352</a>, PubMed:<a href="http://www.uniprot.org/citations/34363755" target="\_blank">34363755</a>). Following activation of toll-like receptors by viral or bacterial components, associates with TRAF3 and TANK and phosphorylates interferon regulatory factors (IRFs) IRF3 and IRF7 as well as DDX3X (PubMed:<a href="http://www.uniprot.org/citations/12692549" target="\_blank">12692549</a>, PubMed:<a href="http://www.uniprot.org/citations/12702806" target="\_blank">12702806</a>, PubMed:<a href="http://www.uniprot.org/citations/14703513" target="\_blank">14703513</a>, PubMed:<a href="http://www.uniprot.org/citations/15367631" target="\_blank">15367631</a>, PubMed:<a href="http://www.uniprot.org/citations/18583960" target="\_blank">18583960</a>, PubMed:<a href="http://www.uniprot.org/citations/25636800" target="\_blank">25636800</a>). This activity allows subsequent homodimerization and nuclear translocation of the IRFs leading to transcriptional activation of pro-inflammatory and antiviral genes including IFNA and IFNB (PubMed:<a href="http://www.uniprot.org/citations/12702806" target="\_blank">12702806</a>, PubMed:<a href="http://www.uniprot.org/citations/15367631" target="\_blank">15367631</a>, PubMed:<a href="http://www.uniprot.org/citations/25636800" target="\_blank">25636800</a>, PubMed:<a href="http://www.uniprot.org/citations/32972995" target="\_blank">32972995</a>). In order to establish such an antiviral state, TBK1 form several different complexes whose composition depends on the type of cell and cellular stimuli (PubMed:<a href="http://www.uniprot.org/citations/23453971" target="\_blank">23453971</a>, PubMed:<a href="http://www.uniprot.org/citations/23453972" target="\_blank">23453972</a>, PubMed:<a href="http://www.uniprot.org/citations/23746807" target="\_blank">23746807</a>). Plays a key role in IRF3 activation: acts by first phosphorylating innate adapter proteins MAVS, STING1 and TICAM1 on their pLxIS motif, leading to recruitment of IRF3, thereby licensing IRF3 for phosphorylation by TBK1 (PubMed:<a href="http://www.uniprot.org/citations/25636800" target="\_blank">25636800</a>, PubMed:<a href="http://www.uniprot.org/citations/30842653" target="\_blank">30842653</a>). Phosphorylated IRF3 dissociates from the adapter proteins, dimerizes, and then enters the nucleus to induce expression of interferons (PubMed:<a href="http://www.uniprot.org/citations/25636800" target="\_blank">25636800</a>). Thus, several scaffolding molecules including FADD, TRADD, MAVS, AZI2, TANK or TBKBP1/SINTBAD can be recruited to the TBK1- containing-complexes (PubMed:<a href="http://www.uniprot.org/citations/21931631" target="\_blank">21931631</a>). Under particular conditions, functions as a NF-kappa-B effector by phosphorylating NF-kappa-B inhibitor alpha/NFKBIA, IKBKB or RELA to translocate NF-Kappa-B to the nucleus (PubMed:<a href="http://www.uniprot.org/citations/10783893" target="\_blank">10783893</a>, PubMed:<a href="http://www.uniprot.org/citations/15489227" target="\_blank">15489227</a>). Restricts bacterial proliferation by phosphorylating the autophagy receptor OPTN/Optineurin on 'Ser-177', thus enhancing LC3 binding affinity and antibacterial autophagy (PubMed:<a href="http://www.uniprot.org/citations/21617041" target="\_blank">21617041</a>). Phosphorylates SMCR8 component of the C9orf72-SMCR8 complex, promoting autophagosome maturation (PubMed:<a href="http://www.uniprot.org/citations/27103069" target="\_blank">27103069</a>). Phosphorylates ATG8 proteins MAP1LC3C and GABARAPL2, thereby preventing their delipidation and premature removal from nascent autophagosomes (PubMed:<a href="http://www.uniprot.org/citations/31709703" target="\_blank">31709703</a>). Phosphorylates and activates AKT1 (PubMed:<a href="http://www.uniprot.org/citations/21464307" target="\_blank">21464307</a>). Seems to play a role in energy balance regulation by sustaining a state of chronic, low-grade inflammation in obesity, wich leads to a negative impact on insulin sensitivity (By similarity). Attenuates retroviral budding by phosphorylating the endosomal sorting complex required for transport-I (ESCRT-I) subunit VPS37C (PubMed:<a

[21270402](http://www.uniprot.org/citations/21270402)). Phosphorylates Borna disease virus (BDV) P protein (PubMed: [16155125](http://www.uniprot.org/citations/16155125)). Plays an essential role in the TLR3- and IFN-dependent control of herpes virus HSV-1 and HSV-2 infections in the central nervous system (PubMed: [22851595](http://www.uniprot.org/citations/22851595)). Acts both as a positive and negative regulator of the mTORC1 complex, depending on the context: activates mTORC1 in response to growth factors by catalyzing phosphorylation of MTOR, while it limits the mTORC1 complex by promoting phosphorylation of RPTOR (PubMed: [29150432](http://www.uniprot.org/citations/29150432)), PubMed: [31530866](http://www.uniprot.org/citations/31530866)). Involved in the regulation of TNF-induced RIPK1-mediated cell death, probably acting via CYLD phosphorylation that in turn controls RIPK1 ubiquitination status (PubMed: [34363755](http://www.uniprot.org/citations/34363755)). Participates also in the differentiation of T follicular regulatory cells together with the receptor ICOS (PubMed: [27135603](http://www.uniprot.org/citations/27135603)).

#### Cellular Location

Cytoplasm. Note=Upon mitogen stimulation or triggering of the immune system, TBK1 is recruited to the exocyst by EXOC2.

#### Tissue Location

Ubiquitous with higher expression in testis. Expressed in the ganglion cells, nerve fiber layer and microvasculature of the retina.

#### NAK Antibody - Protocols

Provided below are standard protocols that you may find useful for product applications.

Immunocytochemistry of NAK in MOLT4 cells with NAK antibody at 10 µg/mL.

## NAK Antibody - Background

NAK Antibody: Nuclear factor kappa B (NF- $\kappa$ B) is a ubiquitous transcription factor and an essential mediator of gene expression during activation of immune and inflammatory responses. NF- $\kappa$ B mediates the expression of a great variety of genes in response to extracellular stimuli. NF- $\kappa$ B is associated with I $\kappa$ B proteins in the cell cytoplasm, which inhibit NF- $\kappa$ B activity. Phosphorylation of I-kappaB by I $\kappa$ B kinase (IKK) complex leads to degradation of I-kappaB and activation of NF- $\kappa$ B. The IKK complex contains IKK $\alpha$ , IKK $\beta$ , and IKK $\gamma$ . A novel IKK related kinase was recently identified and designated TBK1 (TANK-binding kinase 1), NAK (NF- $\kappa$ B-activating kinase), and T2K. NAK/TBK1 activates IKK $\beta$  through direct phosphorylation. NAK/TBK1 is activated by growth factors and PMA and mediates IKK and NF- $\kappa$ B activation in response to growth factors. NAK/TBK1 functions upstream of NIK and the IKK complex. NAK/TBK1 is also critical in protecting embryonic liver from apoptosis.
