Function

NADPH oxidase that catalyzes predominantly the reduction of oxygen to H₂O₂ (PubMed:14966267, PubMed:15356101, PubMed:15927447, PubMed:21343298, PubMed:25062272). Can also catalyze to a smaller extent, the reduction of oxygen to superoxide (PubMed:<a

May function as an oxygen sensor regulating the KCNK3/TASK-1 potassium channel and HIF1A activity (PubMed: [16019190](http://www.uniprot.org/citations/16019190)). May regulate insulin signaling cascade (PubMed: [14966267](http://www.uniprot.org/citations/14966267)). May play a role in apoptosis, bone resorption and lipopolysaccharide-mediated activation of NFkB (PubMed: [15356101](http://www.uniprot.org/citations/15356101), PubMed: [15572675](http://www.uniprot.org/citations/15572675)). May produce superoxide in the nucleus and play a role in regulating gene expression upon cell stimulation (PubMed: [16324151](http://www.uniprot.org/citations/16324151)).

NOX4 Antibody - Background

The NOX family of NADPH oxidases is comprised of seven transmembrane proteins that oxidize intracellular NADPH/NADH, causing electron transport across the membrane and the reduction of molecular oxygen to superoxide (1). NOX4 is expressed in multiple tissues and catalyzes the reduction of molecular oxygen to various reactive oxygen species (ROS) (2,3). Unlike other NOX proteins, NOX4 does not require cytosolic subunits and thus is constitutively active (4). The function of NOX4 remains unclear as it plays both protective and deleterious roles in cellular metabolism.
