

# Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody

Cdc2 p34 Antibody Catalog # ASR4135

#### **Specification**

Application

## Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody - Product Information

Host Mouse

Conjugate
Target Species
Reactivity
Clonality

Unconjugated
Human
Human
Monoclonal

Application Note Anti-p34 cdc2 has been tested by western

blot and is suitable for immunohistochemistry,

WB, E, IP, I, LCI

immunoprecipitation (as active

kinase), and immunoblotting. The antibody detects the three bands within the 34kD region corresponding to the p34 protein and its cleavage products. HeLa cell lysate or human colon carcinoma is suggested as a positive control for immunoblotting. LEP fibroblast cell lysate is suggested as a negative control. Paraffin embedded

tissue is reactive for

immunohistochemistry using high temperature release and 0.1% saponin treatment or other permeabilization

method.

Physical State Liquid (sterile filtered)

Buffer 0.02 M Potassium Phosphate, 0.5 M

Sodium Chloride, pH 7.2

Immunogen This protein A purified monoclonal antibody was produced by repeated

immunizations with recombinant human

p34 cdc2 fusion protein.

Preservative 0.01% (w/v) Sodium Azide

#### Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody - Additional Information

Gene ID 983

Other Names 983

### **Purity**

This protein A purified mouse monoclonal antibody reacts specifically with p34 cdc2 in human tissues and cell lines. This antibody is not cross reactive with other cyclin dependent kinases. Cross reactivity with p34 cdc2 from other sources, especially mouse and rat will occur. This reagent has broad interspecies reactivity.

## **Storage Condition**

Store vial at -20° C prior to opening. Aliquot contents and freeze at -20° C or below for extended storage. Avoid cycles of freezing and thawing. Centrifuge product if not completely clear after standing at room temperature. This product is stable for several weeks at 4° C as an undiluted liquid. Dilute only prior to immediate use.

#### **Precautions Note**

This product is for research use only and is not intended for therapeutic or diagnostic applications.

### Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody - Protein Information

#### Name CDK1

Synonyms CDC2, CDC28A, CDKN1, P34CDC2

#### **Function**

```
Plays a key role in the control of the eukaryotic cell cycle by modulating the centrosome cycle as
well as mitotic onset; promotes G2-M transition via association with multiple interphase cyclins

CDK1/CDC2-cyclin-B controls pronuclear union in interphase fertilized eggs (PubMed:<a href="http://www.uniprot.org/citations/18480403" target="\_blank">18480403</a>, PubMed:<a href="http://www.uniprot.org/citations/20360007" target="\_blank">20360007</a>). Essential for early stages of embryonic development (PubMed:<a href="http://www.uniprot.org/citations/18480403" target=" blank">18480403</a>, PubMed:<a href="http://www.uniprot.org/citations/20360007" target="\_blank">20360007</a>). During G2 and early mitosis, CDC25A/B/C-mediated dephosphorylation activates CDK1/cyclin complexes which phosphorylate several substrates that trigger at least centrosome separation, Golgi dynamics, nuclear envelope breakdown and chromosome condensation (PubMed: <a href="http://www.uniprot.org/citations/18480403" target=" blank">18480403</a>, PubMed:<a href="http://www.uniprot.org/citations/20360007" target="blank">20360007</a>, PubMed:<a href="http://www.uniprot.org/citations/2188730" target="blank">2188730</a>, PubMed:<a href="http://www.uniprot.org/citations/2344612" target="blank">2344612</a>, PubMed:<a href="http://www.uniprot.org/citations/30139873" target=" blank">30139873</a>). Once chromosomes are condensed and aligned at the metaphase plate, CDK1 activity is switched off by WEE1- and PKMYT1-mediated phosphorylation to allow sister chromatid separation, chromosome decondensation, reformation of the nuclear envelope and cytokinesis (PubMed:<a href="http://www.uniprot.org/citations/18480403" target=" blank">18480403</a>, PubMed:<a href="http://www.uniprot.org/citations/20360007" target=" blank">20360007</a>). Phosphorylates KRT5 during prometaphase and metaphase (By similarity). Inactivated by PKR/EIF2AK2- and WEE1-mediated phosphorylation upon DNA damage to stop cell cycle and genome replication at the G2 checkpoint thus facilitating DNA repair (PubMed: <a href="http://www.uniprot.org/citations/20360007" target="\_blank">20360007</a>). Reactivated after successful DNA repair through WIP1-dependent signaling leading to CDC25A/B/C-mediated dephosphorylation and restoring cell cycle progression (PubMed: <a href="http://www.uniprot.org/citations/20395957" target=" blank">20395957</a>). Catalyzes lamin (LMNA, LMNB1 and LMNB2) phosphorylation at the onset of mitosis, promoting nuclear envelope breakdown (PubMed: <a href="http://www.uniprot.org/citations/2188730" target=" blank">2188730</a>, PubMed:<a href="http://www.uniprot.org/citations/2344612" target="blank">2344612</a>, PubMed:<a href="http://www.uniprot.org/citations/37788673" target=" blank">37788673</a>). In proliferating cells, CDK1-mediated FOXO1 phosphorylation at the G2-M phase represses FOXO1 interaction with 14-3-3 proteins and thereby promotes FOXO1 nuclear accumulation and transcription factor activity, leading to cell death of postmitotic neurons (PubMed:<a href="http://www.uniprot.org/citations/18356527" target=" blank">18356527</a>). The phosphorylation of beta-tubulins regulates microtubule dynamics during mitosis (PubMed: <a href="http://www.uniprot.org/citations/16371510" target=" blank">16371510</a>). NEDD1 phosphorylation promotes PLK1-mediated NEDD1 phosphorylation and subsequent targeting of the gamma-tubulin ring complex (gTuRC) to the centrosome, an important step for spindle formation (PubMed:<a href="http://www.uniprot.org/citations/19509060" target=" blank">19509060</a>). In addition, CC2D1A phosphorylation regulates CC2D1A spindle pole localization and association with SCC1/RAD21 and centriole cohesion during mitosis (PubMed: <a

href="http://www.uniprot.org/citations/20171170" target="blank">20171170</a>). The phosphorylation of Bcl-xL/BCL2L1 after prolongated G2 arrest upon DNA damage triggers apoptosis (PubMed: <a href="http://www.uniprot.org/citations/19917720" target=" blank">19917720</a>). In contrast, CASP8 phosphorylation during mitosis prevents its activation by proteolysis and subsequent apoptosis (PubMed:<a href="http://www.uniprot.org/citations/20937773" target=" blank">20937773</a>). This phosphorylation occurs in cancer cell lines, as well as in primary breast tissues and lymphocytes (PubMed:<a href="http://www.uniprot.org/citations/20937773" target=" blank">20937773</a>). EZH2 phosphorylation promotes H3K27me3 maintenance and epigenetic gene silencing (PubMed:<a href="http://www.uniprot.org/citations/20935635" target=" blank">20935635</a>). CALD1 phosphorylation promotes Schwann cell migration during peripheral nerve regeneration (By similarity). CDK1-cyclin-B complex phosphorylates NCKAP5L and mediates its dissociation from centrosomes during mitosis (PubMed: <a href="http://www.uniprot.org/citations/26549230" target=" blank">26549230</a>). Regulates the amplitude of the cyclic expression of the core clock gene BMAL1 by phosphorylating its transcriptional repressor NR1D1, and this phosphorylation is necessary for SCF(FBXW7)- mediated ubiquitination and proteasomal degradation of NR1D1 (PubMed: <a href="http://www.uniprot.org/citations/27238018" target=" blank">27238018</a>). Phosphorylates EML3 at 'Thr-881' which is essential for its interaction with HAUS augmin-like complex and TUBG1 (PubMed: <a href="http://www.uniprot.org/citations/30723163" target=" blank">30723163</a>). Phosphorylates CGAS during mitosis, leading to its inhibition, thereby preventing CGAS activation by self DNA during mitosis (PubMed: <a href="http://www.uniprot.org/citations/32351706" target=" blank">32351706</a>). Phosphorylates SKA3 on multiple sites during mitosis which promotes SKA3 binding to the NDC80 complex and anchoring of the SKA complex to kinetochores, to enable stable attachment of mitotic spindle microtubules to kinetochores (PubMed: <a href="http://www.uniprot.org/citations/28479321" target="\_blank">28479321</a>, PubMed:<a href="http://www.uniprot.org/citations/31804178" target="blank">31804178</a>, PubMed:<a href="http://www.uniprot.org/citations/32491969" target=" blank">32491969</a>).

#### **Cellular Location**

Nucleus {ECO:0000250|UniProtKB:P11440}. Cytoplasm {ECO:0000250|UniProtKB:P11440}. Mitochondrion. Cytoplasm, cytoskeleton, microtubule organizing center, centrosome. Cytoplasm, cytoskeleton, spindle. Note=Cytoplasmic during the interphase Colocalizes with SIRT2 on centrosome during prophase and on splindle fibers during metaphase of the mitotic cell cycle. Reversibly translocated from cytoplasm to nucleus when phosphorylated before G2-M transition when associated with cyclin-B1. Accumulates in mitochondria in G2-arrested cells upon DNA-damage

### **Tissue Location**

[Isoform 2]: Found in breast cancer tissues.

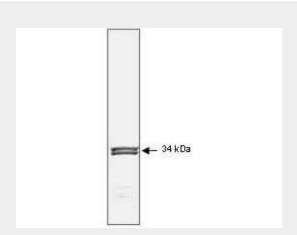

#### Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody - Protocols

Provided below are standard protocols that you may find useful for product applications.

- Western Blot
- Blocking Peptides
- Dot Blot
- Immunohistochemistry
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- Cell Culture

#### Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody - Images

Mab anti-Human p34cdc2 antibody (clone POH-1) is shown to detect human p34cdc2 by western blot. Detection occurs after 10  $\mu$ g of a HeLa whole cell lysate is loaded per lane. The blot was incubated with a 1:1,000 dilution of Mab anti-Human p34cdc2 at room temperature for 30 min followed by detection using IRDye<sup>™</sup> 800 labeled Goat-a-Mouse IgG [H&L] (610-132-121) diluted 1:5,000. A doublet band corresponding to human p34cdc2 is detected at ~34 kDa when compared with known molecular weight standards (not shown). The antibody may be used to detect endogenous human p34cdc2. IRDye<sup>™</sup> 800 fluorescence image was captured using the Odyssey® Infrared Imaging System developed by LI-COR. IRDye is a trademark of LI-COR, Inc. Other detection systems will yield similar results.

## Anti-cdc2 (p34) (MOUSE) Monoclonal Antibody - Background

p34 cdc2 is a serine-threonine protein kinase of 34,000 daltons that complexes with cyclin to form maturation promoting factor (MPF). The inactive form of the protein is phosphorylated at threonine (T) and tyrosine (Y) residues. In humans the phosphorylation appears to be performed by p60src. The active form of the protein is dephosphorylated and it functions by phosphorylating a number of proteins. The phosphorylation activity is coupled to the entry into the M-phase of the cell. p34 cdc2 protein must be associated with a normal cyclin protein for the M-phase to be completed normally. Association with deletion mutants of cyclin halts the M-phase before it is completed.
