GMPS Antibody (monoclonal) (M01) - Background

In the de novo synthesis of purine nucleotides, IMP is the branch point metabolite at which point

the pathway diverges to the synthesis of either guanine or adenine nucleotides. In the guanine nucleotide pathway, there are 2 enzymes involved in converting IMP to GMP, namely IMP dehydrogenase (IMPD1), which catalyzes the oxidation of IMP to XMP, and GMP synthetase, which catalyzes the amination of XMP to GMP.
