

### **CF150 Antibody (Center)**

Affinity Purified Rabbit Polyclonal Antibody (Pab) Catalog # AW5397

### **Specification**

## CF150 Antibody (Center) - Product Information

**Application** WB, FC, E **Primary Accession O8N884** Other Accession NP 612450.2 Reactivity Human Host **Rabbit** Clonality **Polyclonal** Calculated MW H=59,50 KDa Isotype Rabbit IgG **Antigen Source HUMAN** 

### CF150 Antibody (Center) - Additional Information

Gene ID 115004

**Antigen Region** 

266-295

# **Other Names**

Cyclic GMP-AMP synthase, cGAMP synthase, cGAS, h-cGAS, Mab-21 domain-containing protein 1, MB21D1, C6orf150

### **Dilution**

WB~~1:1000 FC~~1:25

# Target/Specificity

This CF150 antibody is generated from rabbits immunized with a KLH conjugated synthetic peptide between 266-295 amino acids from the Central region of human CF150.

### **Format**

Purified polyclonal antibody supplied in PBS with 0.09% (W/V) sodium azide. This antibody is purified through a protein A column, followed by peptide affinity purification.

### **Storage**

Maintain refrigerated at 2-8°C for up to 2 weeks. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.

### **Precautions**

CF150 Antibody (Center) is for research use only and not for use in diagnostic or therapeutic procedures.

# CF150 Antibody (Center) - Protein Information

Name CGAS {ECO:0000303|PubMed:23258413, ECO:0000312|HGNC:HGNC:21367}

#### **Function**

Nucleotidyltransferase that catalyzes the formation of cyclic GMP-AMP (2',3'-cGAMP) from ATP and GTP and plays a key role in innate immunity (PubMed:<a href="http://www.uniprot.org/citations/21478870" target=" blank">21478870</a>, PubMed:<a href="http://www.uniprot.org/citations/23258413" target=" blank">23258413</a>, PubMed:<a href="http://www.uniprot.org/citations/23707061" target="blank">23707061</a>, PubMed:<a href="http://www.uniprot.org/citations/23707065" target="blank">23707065</a>, PubMed:<a href="http://www.uniprot.org/citations/23722159" target="\_blank">23722159</a>, PubMed:<a href="http://www.uniprot.org/citations/24077100" target="blank">24077100</a>, PubMed:<a href="http://www.uniprot.org/citations/24116191" target="blank">24116191</a>, PubMed:<a href="http://www.uniprot.org/citations/24462292" target=" blank">24462292</a>, PubMed:<a href="http://www.uniprot.org/citations/25131990" target=" blank">25131990</a>, PubMed:<a href="http://www.uniprot.org/citations/26300263" target="blank">26300263</a>, PubMed:<a href="http://www.uniprot.org/citations/29976794" target="blank">29976794</a>, PubMed:<a href="http://www.uniprot.org/citations/30799039" target="blank">30799039</a>, PubMed:<a href="http://www.uniprot.org/citations/31142647" target="\_blank">31142647</a>, PubMed:<a href="http://www.uniprot.org/citations/32814054" target=" blank">32814054</a>, PubMed:<a href="http://www.uniprot.org/citations/33273464" target="\_blank">33273464</a>, PubMed:<a href="http://www.uniprot.org/citations/33542149" target=" blank">33542149</a>, PubMed:<a href="http://www.uniprot.org/citations/37217469" target="blank">37217469</a>, PubMed:<a href="http://www.uniprot.org/citations/37802025" target="blank">37802025</a>). Catalysis involves both the formation of a 2',5' phosphodiester linkage at the GpA step and the formation of a 3',5' phosphodiester linkage at the ApG step, producing c[G(2',5')pA(3',5')p] (PubMed:<a href="http://www.uniprot.org/citations/28214358" target=" blank">28214358</a>, PubMed:<a href="http://www.uniprot.org/citations/28363908" target="blank">28363908</a>). Acts as a key DNA sensor: directly binds double-stranded DNA (dsDNA), inducing the formation of liquid-like droplets in which CGAS is activated, leading to synthesis of 2',3'-cGAMP, a second messenger that binds to and activates STING1, thereby triggering type-I interferon production (PubMed: <a href="http://www.uniprot.org/citations/28314590" target=" blank">28314590</a>, PubMed:<a href="http://www.uniprot.org/citations/28363908" target="blank">28363908</a>, PubMed:<a href="http://www.uniprot.org/citations/29976794" target="blank">29976794</a>, PubMed:<a href="http://www.uniprot.org/citations/32817552" target="\_blank">32817552</a>, PubMed:<a href="http://www.uniprot.org/citations/33230297" target="blank">33230297</a>, PubMed:<a href="http://www.uniprot.org/citations/33606975" target="\_blank">33606975</a>, PubMed:<a href="http://www.uniprot.org/citations/35322803" target="blank">35322803</a>, PubMed:<a href="http://www.uniprot.org/citations/35438208" target="blank">35438208</a>, PubMed:<a href="http://www.uniprot.org/citations/35460603" target="\_blank">35460603</a>, PubMed:<a href="http://www.uniprot.org/citations/35503863" target="\_blank">35503863</a>). Preferentially recognizes and binds curved long dsDNAs of a minimal length of 40 bp (PubMed:<a href="http://www.uniprot.org/citations/30007416" target=" blank">30007416</a>). Acts as a key foreign DNA sensor, the presence of double-stranded DNA (dsDNA) in the cytoplasm being a danger signal that triggers the immune responses (PubMed: <a href="http://www.uniprot.org/citations/28363908" target=" blank">28363908</a>). Has antiviral activity by sensing the presence of dsDNA from DNA viruses in the cytoplasm (PubMed:<a href="http://www.uniprot.org/citations/28363908" target="\_blank">28363908</a>, PubMed:<a href="http://www.uniprot.org/citations/35613581" target="blank">35613581</a>). Also acts as an innate immune sensor of infection by retroviruses, such as HIV-2, by detecting the presence of reverse-transcribed DNA in the cytosol (PubMed:<a href="http://www.uniprot.org/citations/23929945" target="\_blank">23929945</a>, PubMed:<a href="http://www.uniprot.org/citations/24269171" target="\_blank">24269171</a>, PubMed:<a href="http://www.uniprot.org/citations/30270045" target="\_blank">30270045</a>, PubMed:<a href="http://www.uniprot.org/citations/32852081" target="\_blank">32852081</a>). In contrast, HIV-1 is poorly sensed by CGAS, due to its capsid that cloaks viral DNA from CGAS detection (PubMed:<a href="http://www.uniprot.org/citations/24269171" target="\_blank">24269171</a>, PubMed:<a href="http://www.uniprot.org/citations/30270045" target="\_blank">30270045</a>,

PubMed:<a href="http://www.uniprot.org/citations/32852081" target=" blank">32852081</a>). Detection of retroviral reverse-transcribed DNA in the cytosol may be indirect and be mediated via interaction with POBP1, which directly binds reverse-transcribed retroviral DNA (PubMed: <a href="http://www.uniprot.org/citations/26046437" target=" blank">26046437</a>). Also detects the presence of DNA from bacteria, such as M.tuberculosis (PubMed: <a href="http://www.uniprot.org/citations/26048138" target=" blank">26048138</a>). 2',3'-cGAMP can be transferred from producing cells to neighboring cells through gap junctions, leading to promote STING1 activation and convey immune response to connecting cells (PubMed: <a href="http://www.uniprot.org/citations/24077100" target="\_blank">24077100</a>). 2',3'-cGAMP can also be transferred between cells by virtue of packaging within viral particles contributing to IFN- induction in newly infected cells in a cGAS-independent but STING1- dependent manner (PubMed:<a href="http://www.uniprot.org/citations/26229115" target=" blank">26229115</a>). Also senses the presence of neutrophil extracellular traps (NETs) that are translocated to the cytosol following phagocytosis, leading to synthesis of 2',3'-cGAMP (PubMed:<a href="http://www.uniprot.org/citations/33688080" target=" blank">33688080</a>). In addition to foreign DNA, can also be activated by endogenous nuclear or mitochondrial DNA (PubMed:<a href="http://www.uniprot.org/citations/28738408" target=" blank">28738408</a>, PubMed:<a href="http://www.uniprot.org/citations/28759889" target="\_blank">28759889</a>, PubMed:<a href="http://www.uniprot.org/citations/31299200" target=" blank">31299200</a>, PubMed:<a href="http://www.uniprot.org/citations/33031745" target="blank">33031745</a>, PubMed:<a href="http://www.uniprot.org/citations/33230297" target="\_blank">33230297</a>). When self-DNA leaks into the cytosol during cellular stress (such as mitochondrial stress, SARS-CoV-2 infection causing severe COVID-19 disease, DNA damage, mitotic arrest or senescence), or is present in form of cytosolic micronuclei, CGAS is activated leading to a state of sterile inflammation (PubMed: <a href="http://www.uniprot.org/citations/28738408" target=" blank">28738408</a>, PubMed:<a href="http://www.uniprot.org/citations/28759889" target=" blank">28759889</a>, PubMed:<a href="http://www.uniprot.org/citations/31299200" target=" blank">31299200</a>, PubMed:<a href="http://www.uniprot.org/citations/33031745" target=" blank">33031745</a>, PubMed:<a href="http://www.uniprot.org/citations/33230297" target="blank">33230297</a>, PubMed:<a href="http://www.uniprot.org/citations/35045565" target="blank">35045565</a>). Acts as a regulator of cellular senescence by binding to cytosolic chromatin fragments that are present in senescent cells, leading to trigger type-I interferon production via STING1 and promote cellular senescence (By similarity). Also involved in the inflammatory response to genome instability and double-stranded DNA breaks: acts by localizing to micronuclei arising from genome instability (PubMed: <a href="http://www.uniprot.org/citations/28738408" target=" blank">28738408</a>, PubMed:<a href="http://www.uniprot.org/citations/28759889" target="blank">28759889</a>). Micronuclei, which are frequently found in cancer cells, consist of chromatin surrounded by their own nuclear membrane: following breakdown of the micronuclear envelope, a process associated with chromothripsis, CGAS binds self-DNA exposed to the cytosol, leading to 2',3'-cGAMP synthesis and subsequent activation of STING1 and type-I interferon production (PubMed:<a href="http://www.uniprot.org/citations/28738408" target=" blank">28738408</a>, PubMed:<a href="http://www.uniprot.org/citations/28759889" target=" blank">28759889</a>). Activated in response to prolonged mitotic arrest, promoting mitotic cell death (PubMed: <a href="http://www.uniprot.org/citations/31299200" target=" blank">31299200</a>). In a healthy cell, CGAS is however kept inactive even in cellular events that directly expose it to self-DNA, such as mitosis, when cGAS associates with chromatin directly after nuclear envelope breakdown or remains in the form of postmitotic persistent nuclear cGAS pools bound to chromatin (PubMed: <a href="http://www.uniprot.org/citations/31299200" target=" blank">31299200</a>, PubMed:<a href="http://www.uniprot.org/citations/33542149" target=" blank">33542149</a>). Nuclear CGAS is inactivated by chromatin via direct interaction with nucleosomes, which block CGAS from DNA binding and thus prevent CGAS-induced autoimmunity (PubMed:<a href="http://www.uniprot.org/citations/31299200" target=" blank">31299200</a>, PubMed:<a href="http://www.uniprot.org/citations/32911482" target="\_blank">32911482</a>, PubMed:<a href="http://www.uniprot.org/citations/32912999" target="blank">32912999</a>, PubMed:<a href="http://www.uniprot.org/citations/33051594" target="blank">33051594</a>, PubMed:<a href="http://www.uniprot.org/citations/33542149" target="blank">33542149</a>). Also acts as

a suppressor of DNA repair in response to DNA damage: inhibits homologous recombination repair by interacting with PARP1, the CGAS-PARP1 interaction leading to impede the formation of the PARP1-TIMELESS complex (PubMed:<a href="http://www.uniprot.org/citations/30356214" target="\_blank">30356214</a>, PubMed:<a href="http://www.uniprot.org/citations/31544964" target="\_blank">31544964</a>). In addition to DNA, also sense translation stress: in response to translation stress, translocates to the cytosol and associates with collided ribosomes, promoting its activation and triggering type-I interferon production (PubMed:<a href="http://www.uniprot.org/citations/34111399" target="\_blank">34111399</a>/a>). In contrast to other mammals, human CGAS displays species-specific mechanisms of DNA recognition and produces less 2',3'-cGAMP, allowing a more fine-tuned response to pathogens (PubMed:<a href="http://www.uniprot.org/citations/30007416" target=" blank">30007416</a>/a>).

### **Cellular Location**

Nucleus. Chromosome. Cell membrane; Peripheral membrane protein. Cytoplasm, cytosol. Note=Mainly localizes in the nucleus, and at low level in the cytosol (PubMed:31544964, PubMed:31808743). On chromosomes, enriched on centromeric satellite and LINE DNA repeat elements (PubMed:30811988). Exported from the nucleus to the cytosol in a XPO1/CRM1 via the nuclear export signal in response to DNA stimulation (PubMed:33406424). Outside the nucleus, localizes at the cell membrane as a peripheral membrane protein in resting conditions: association to the cell membrane is mediated via binding to phosphatidylinositol 4,5-bisphosphate (PtdIns(4,5)P2) (PubMed:30827685). Localization at the cell membrane is required to limit the recognition of self-DNA (PubMed:30827685). Following detection of double-stranded DNA (dsDNA), released from the cell membrane into the cytosol in order to signal (PubMed:30827685). Upon transfection with dsDNA forms punctate structures that co-localize with DNA and Beclin-1 (BECN1) (PubMed:26048138). Phosphorylation at Tyr-215 promotes cytosolic retention (PubMed:30356214). In response to translation stress, translocates to the cytosol and associates with collided ribosomes (PubMed:34111399).

#### **Tissue Location**

Expressed in the monocytic cell line THP1.

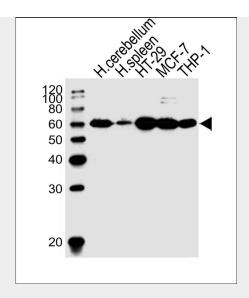

### CF150 Antibody (Center) - Protocols

Provided below are standard protocols that you may find useful for product applications.

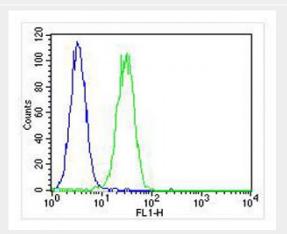

- Western Blot
- Blocking Peptides
- Dot Blot
- <u>Immunohistochemistry</u>
- Immunofluorescence
- Immunoprecipitation
- Flow Cytomety
- Cell Culture

# CF150 Antibody (Center) - Images

All lanes: Anti-CF150 Antibody (Center) at 1:1000 dilution Lane 1: human cerebellum lysates Lane 2: human spleen lysates Lane 3: HT-29 whole cell lysates Lane 4: MCF-7 whole cell lysates Lane 5: THP-1 whole cell lysates Lysates/proteins at 20  $\mu$ g per lane. Secondary Goat Anti-Rabbit lgG, (H+L),Peroxidase conjugated at 1/10000 dilution Predicted band size: 59 kDa Blocking/Dilution buffer: 5% NFDM/TBST.

Overlay histogram showing U-2OS cells stained with AW5397 (green line). The cells were fixed with 2% paraformaldehyde (10 min) and then permeabilized with 90% methanol for 10 min. The cells were then icubated in 2% bovine serum albumin to block non-specific protein-protein interactions followed by the antibody (AW5397, 1:25 dilution) for 60 min at 37°C. The secondary antibody used was Goat-Anti-Rabbit IgG, DyLight® 488 Conjugated Highly Cross-Adsorbed(NA168821) at 1/400 dilution for 40 min at 37°C. Isotype control antibody (blue line) was rabbit  $IgG (1\mu g/1 \times 10^6 cells)$  used under the same conditions. Acquisition of >10, 000 events was performed.

### CF150 Antibody (Center) - Background

The exact function of C6orf150 remains unknown.
